Portfoli Project

This website features the portfolio of mine which is mostly targeted for a job and academic purpose so my target audience is very limited to employer. I have designed in base on mac device like MacBook, IPad and iPhone. My designed is simple and targeted to make responsive and give a real feeling of actually using a device.

I have tried to repeat as less code as possible and use most of CSS so that HTML page look clean and good. Tried to make classes and use where I can use.

Design process

After going through lot of idea, what i can do and time limit o decide to make website looks like a mac devices with couple of different pages and navigating within the page with the help of navigation button.

Problem, challenges and final product

There was a problem with every step what i was trying to do and excitement at same because i was learning new things. The main challenges where making responsive design and choosing the right way and right technique between many techniques. Most of the time different section of page where collapsing and things were hiding. Animation was another challenge and i have to let it go some of my idea to make smoother website and save time.

During the process the things i learn was flex box and have got some trick which makes easy to create responsive website.
